Old questions:

Explain the importance of database normalization in web development.

Explain the use of alter, update, and delete queries with example

Data:

Raw facts and figures that can be processed to gain meaningful information. It could be numbers, text, images, or any form of digital representation.

Database:

An organized collection of data that is stored and managed efficiently. It allows retrieval, modification, and deletion of data easily. Examples include relational databases, NoSQL databases, and graph databases.

Database Managemet System:

Software that enables users to interact with databases. It provides tools to store, retrieve, and manage data effectively. Popular DBMSs include MySQL, PostgreSQL, Microsoft SQL Server, and Oracle DB.

SQL

Structured Query Language(SQL), which is a computer language for storing, manipulating and retrieving data stored in relational database management system(RDBMS). SQL was developed at IBM by Donald Chamberlin, Donald C.Messerli, and Raymond F.Boyce in the year 1970s

MySQL

MySQL is an open-source Relational Database Management System that stores data in a stored format using rows and columns. MySQL language is easy to use as compared to other programming language like C, C++, Java, etc. By learning some basic commands we can work, create and interact with the Database.

Applications of MySQL:

- MySQL used in E-commerce websites
- MySQL used in Data Warehousing
- MYSQL is used in the Login Application

How Does MySQL work?

MySQL is open-source and user friendly. It creates a database to store and manipulate the data. To perform various operations users make requests by typing specific statements. The server responds to the information from the user and Displays it on the user side.

MySQL Queries:

MySQL Queries are commands written in the SQL (Structured Query Language) that are used to interact with a MySQL database. SQL is a standard language for interacting with relational databases and MySQL is a popular relational database management system.
